Applicant argues that the phone book and datebook disclosed by **Pepper et al.** are not line appearance signals as described in claim 1. Examiner respectfully disagrees because **Pepper et al.** discloses clearly in Fig.3, when a call comes in for a subscriber, the TNI 304 answers the call and alerts the service control module 306 that a call has been received for a given line which may be determined by Dialed Number Identification Service (DNIS) from a given location which may be determined by Automatic Number Identification (ANI) (e.g., "caller ID"). The service control module 306 uses the DNIS information, phone book data base (See Fig.8) which is included in a network database 308 to identify the call origin and determine who the subscriber is. Applicant is directed to see col.6, lines 12-25.
